About me

I have spent eight years building and running platforms for backend teams, mostly in Java. People at work call me Inge. I want to move closer to Python services.

Skills

| Area          | Tools                         | Years |
|---------------|-------------------------------|-------|
| Containers    | Docker, Kubernetes, Helm      | 6     |
| Cloud         | AWS, Terraform                | 7     |
| Observability | Prometheus, Grafana, alerting | 6     |
| Languages     | Java, Go, some Python         | 8     |
| Databases     | PostgreSQL basics             | 3     |
| Testing       | JUnit, smoke tests            | 5     |

Experience

Platform Engineer, Ironbridge Cloud, 2019 to present

I built the container build and deployment pipeline for 30 Java services: images, Helm charts, canary releases and rollbacks. I wrote the Terraform modules for the network, databases and clusters, and led the move of the platform to a second AWS region, which cut cloud cost by 22 percent. I set the service level objectives with the product teams, built the alerts and the on-call runbooks, and led incident reviews; outages per quarter fell from nine to three.

I use Python for glue scripts and a small internal tool with a Flask endpoint that lists deployments. I have not built a customer-facing API in Python.

I use PostgreSQL as a user: I create databases, set up backups and read query plans with the app teams, but I do not design schemas.

I write JUnit tests for the Java libraries I maintain and smoke tests that run after every deploy.

Software Engineer, Tamsin Software, 2016 to 2019

Java backend developer on a booking platform.
